

A BASIC AKKA PRESENTATION

By [@fpaschos](#)

SCHEDULE

Today we will

Give a small theory presentation about **akka**

Give a **scala crash course** for java devs **:P**

Present a trivial **bank account management** system written using **akka-typed, akka-http and scala**

SOME BASIC NOTIONS (1)

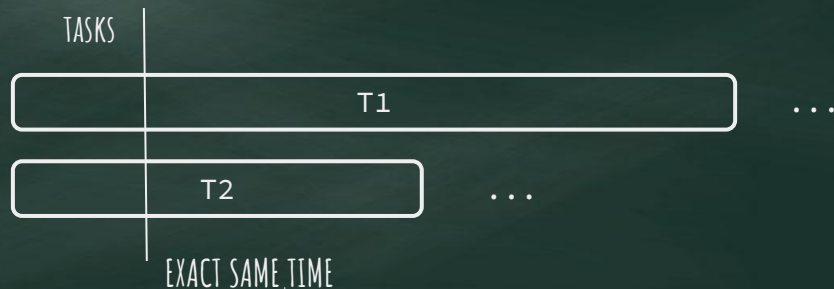

CONCURRENCY

Means that we can execute **multiple** things at a given **amount of time**.

PARALLELISM

Means that we can execute things at **the exact same time**.

SOME BASIC NOTIONS (2)

PERFORMANCE

Means **how fast** things are being executed.

SCALABILITY

Is the ability of a **system** to **handle** larger amounts of **work** by **adding** resources.

ORTHOGONAL PROPERTIES

You may have both but many times you may **sacrifice** a little bit of **performance to gain scalability**.

SOME BASIC NOTIONS (3)

There are more properties that we are interested in ...

RESILIENCE
(SYSTEM)

ELASTICITY
(SYSTEM)

AVAILABILITY
(SYSTEM)

RESPONSIVENESS
(SYSTEM)

EFFICIENCY
(HUMANS)

CONSISTENCY
(DATA)

WHAT IS AKKA ?

“Akka is a set of open source **libraries** for designing **scalable, resilient** system that **span processor** cores and **networks.**”

(*quoted from akka.io documentation)

Akka is about:

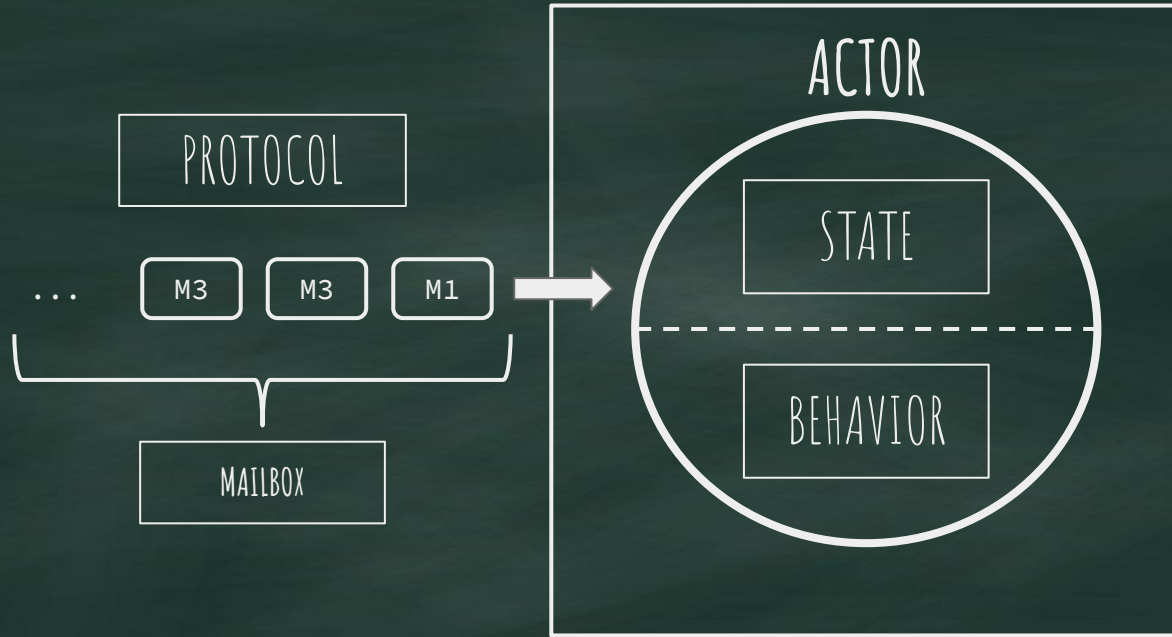

- Scalability
- Concurrency & Parallelism
- Resiliency
- Workload distribution
- Performance
- Efficiency

ARCHITECTURE EAGLE VIEW

** FROM ECOSYSTEM AND MANY MORE....

ANATOMY OF AN ACTOR

AN ACTOR IS NO ACTOR

SYSTEM

SYSTEM

ENOUGH TALKING SHOW ME THE CODE

A bank account management system example
